Craniosacral Therapy and Attention Deficit Disorder

Craniosacral therapy is a gentle, hands-on therapeutic modality that may have a profoundly positive effect on brain and spinal cord function. Application of this modality can also positively influence the endocrine and immune systems. It seems especially effective at relieving excess tension patterns and restricted motion in both osseous and membranous anatomical regions and relationships.

By relieving excess tension in the meningeal membranes, the impairment of related nervous tissue function is often restored. By restoring bone mobility in the skull, spinal column, rib cage and pelvis, abnormal restrictive anchorings of these meningeal membranes are removed. This restoration of natural mobility of the individual bones of the skull also allows the natural junctures (joints) between these bones to resume their normal pumping and accommodative activities.

The net result of all this is to enhance the movement of fluids throughout the central nervous system and its related structures and systems. Physiological fluid movement is essential to the healthy function of any tissue and organ, whether it be brain, bone, muscle, etc. Fluid is the vehicle used by the body's physiological mechanisms to remove metabolic and toxic wastes from within cells and from intracellular spaces. Fluid is also the vehicle the body uses to deliver nutrients and antibodies, and to carry messenger substances such as hormones, neuropeptides and electrically charged ions and particles that are so important to physiological function.

Craniosacral therapy has been used quite successfully in the treatment of attention deficit disorder (ADD) and hyperkinesis since 1975. Our clinical experience suggests that, in a significant number of ADD and hyperkinesis cases, a structural problem may be a primary contributing factor to the symptom complex. When this structural problem is present and corrected, the symptoms of ADD and/or hyperkinesis disappear very quickly, quite often in minutes or hours. If the structural correction holds the treatment, the effects can be permanent.

Sometimes the structural problem requires multiple corrections. However, with each therapeutic treatment, the corrective process becomes easier and the symptomatic improvement lasts longer until, ultimately, neither the structural problem nor the ADD and/or hyperkinesis symptoms recur.

The structural problem that often seems to be causally related to ADD and/or hyperkinesis is one that may frequently occur during obstetrical delivery. It happens when there is an excessive back-bending (hyperextension) of the occipital bone base of the skull upon the first cervical vertebra (atlas). The joint surfaces between this occipital bone and the atlas form a horizontally oriented V-shape, with the point of the "V" facing forward. The most common delivery position for the newborn is facing toward the back of the mother's body. Therefore, the back of the newborn's head comes under the mother's pubic bone complex. In so doing, the head may be severely angulated upon the neck.

This position represents a very threatening situation to the newborn's nervous system. (The neck could be broken if angulation goes much further.) An obvious response to this kind of threat is to splint or contract the tissues (muscles, etc.) to prevent life-threatening damage. When the delivery is over, the splinted tissues may or may not relax. If they do not relax, the occiput remains in a locked forward (hyperextended) position on the
Great Times in Orlando at FSMTA Annual Convention

Cont’d from page 1

July 5-8 in Orlando, Florida. This annual event has become one of the premier massage and bodywork assemblies in the nation, and this year’s record attendance underscored that fact. Counting exhibitors, trade-show-only guests, and convention registrants, more than 1,300 individuals enjoyed the opportunity to obtain CEUs, meet with vendors, suppliers and peers, and have a great time together!

Orlando in July is hot and humid, but very few of the convention attendees seemed to mind. The convention opened with a well-attended welcoming dinner, followed by the keynote speaker (and Massage Today columnist) Steve Capellini. Steve spoke to the audience about “The Spa Convergence,” outlining the evolving relationship between the medical and spa communities. (Editor’s note: a complete transcript of Steve’s presentation can be found on line at www.royaltreatment.com.)

The educational offerings were vast, allowing up to 18 CEUs to attendees. Nationally known presenters such as Roy Desjarlais, Erik Dalton, Judith DeLany and others taught a wide array of topics covering the breadth of massage therapy and bodywork. In addition to the more standard offerings such as “NMT on Forearms/Hands,” “Success in Your Practice,” and “Techniques for Neck Pain,” a number of unique educational opportunities were available. I particularly noted Ben Dillard’s “Humor in Health,” Lee Chaffee’s “Russian Chair Massage” (you must try this chair massage routine, it’s terrific!), and Mya Bremen’s fascinating “Equine CranioSacral Therapy,” featuring
